SIM-2026-028 null control (L=8): holographic vs non-holographic finite-T transport -- HOLOGRAPHIC_SIGNAL_BEYOND_WASHOUT
(a) Raw amplitude degradation
both fall, but the control lags (large gap)
holographic (critical Ising)
control (gapped paramagnet)
normalized transport amplitude $A(\beta)/A_{\rm cold}$
inverse temperature β
(b) Washout-normalized: control FLAT, holographic STRUCTURED
max gap = 183% -> signal beyond washout
holographic
control
pure washout (=1)
control = pure
thermal washout
holographic: residual
degradation (candidate horizon)
washout-normalized $A(\beta)/\sqrt{\text{purity}}$ (norm.)
inverse temperature β
